

TransTech Systems

Non-Nuclear Gauges: Easy to Own, Easy to Use.

TransTech Systems offers the world's first and leading non-nuclear density gauges for asphalt and soil: the PQI 380+ and SDG 200. These gauges are lightweight, user friendly, and designed to make ownership simpler than traditional nuclear density gauges. No Nuclear Material Means Fewer Compliance Burdens. Because TransTech Systems gauges are electrical and contain no nuclear material, owners avoid many of the regulatory requirements associated with nuclear density gauges.

In contrast, nuclear gauge ownership often involves:

- **Restrictions on transporting the gauges**
- **Required dosimetry badges during use**
- **Strict storage and disposal requirements, along with related costs**
- **Radiation safety and operation training for operators**
- **A National Radioactive Materials license**
- **A trained Radiation Safety Officer to manage compliance and oversight**

Continued licensing can be one of the most expensive parts of nuclear gauge ownership. The license cost will vary from country to country but is a cost not associated with electric impedance density gauges. For many former nuclear gauge owners, reducing cost, complexity, and regulatory hassle is a major reason to switch to TransTech Systems non-nuclear devices for Quality Control programs.

With a TransTech Systems gauge, the costs and administrative burdens associated with nuclear gauges are no longer an issue. Employees can also work more effectively and efficiently by utilizing TransTech Connect, a cloud quality-control platform built exclusively for TransTech Systems non-nuclear density gauges. Paired with the PQI380+, TransTech Connect streams density readings from the mat to the office as they are taken, the first system in the asphalt industry to combine fully non-nuclear electromagnetic density sensing with live cloud synchronization.
